

A SIMPLE VISUAL WORKFLOW

FROM PLANS TO PHOTOREAL

How we turn architectural drawings into photoreal images and cinematic video, using the best AI tools available today. The concept, the tools, and the flow, start to finish.

01

PLANS

The real drawings

02

IMAGES

Photoreal stills

03

MOTION

Short film clips

04

STORY

The finished walkthrough

2

CREATIVE STAGES

Images, then motion

4

AI TOOLS

Gemini, Veo, Runway, Kling

1

SIMPLE FLOW

Plans in, film out

PLANS IN. PHOTOREAL OUT.

The whole process is four simple moves. We start with the architect's real drawings and let AI do the rendering, first as still images, then as motion. No cameras, no crews, no waiting weeks on an outside rendering house.

1

START WITH THE PLANS

We begin with the same drawings the design team uses. The elevations, the site plan, the materials. Real inputs, not guesswork, so the result is our building and not a generic one.

2

CREATE THE IMAGES

AI turns those plans into photoreal still images. The building at golden hour, the pool at dusk, the streetscape full of life. We make several versions and keep the strongest.

3

ADD THE MOTION

A chosen image becomes a short, moving clip. A slow push toward the entrance. A drift across the amenity deck. This is where a flat picture turns cinematic.

4

TELL THE STORY

We assemble the clips into a walkthrough for the pitch deck, the website, or an investor update. One short film, built from still drawings.

The plans keep it honest. Because we feed in the real architectural drawings, the AI holds the true shape, scale, and materials of the building. That is the difference between a genuine marketing asset and generic AI art.

FIRST, WE MAKE THE PICTURES.

Everything starts with a still image. Using Google's Gemini, we turn the plans into photoreal pictures of the building and community, make several versions, and keep the best. Win here and the rest is easy.

THE ENGINE | GEMINI, BY GOOGLE

Gemini is our single image engine. We hand it the real plans plus a plain description, and it returns photoreal stills that match the actual building, not a generic lookalike. Fast and inexpensive, so we can try many looks before choosing.

WHAT | GOES INTO A GREAT IMAGE

- **The real plans.** Elevations, site plan, and materials, so the AI builds the actual building and not a lookalike.
- **A plain description.** Golden hour, dusk by the pool, a lively streetscape. We describe the scene in everyday words.
- **Options to choose from.** We generate several versions every time and keep the single strongest one.

FOR EXAMPLE | WHAT WE ASK FOR

"A photoreal street view of the clubhouse entrance at golden hour, warm lighting, mature landscaping, residents walking."

Why images first. A still image costs pennies and takes seconds. It is the cheapest place to get the look, the light, and the angle right, long before we spend on video.

THEN, WE BRING IT TO LIFE.

We take the best still image and turn it into a short, moving clip. A slow push toward the entrance. A drift across the amenity deck. We have four ways to add motion, from premium AI to a classic, no cost technique.

TOOL	WHAT IT IS	REACH FOR IT
VEO GOOGLE · PREMIUM	Google's premium video AI. The most lifelike motion, light, and reflection.	The hero shot, the money moment.
RUNWAY RUNWAY · CINEMATIC	The filmmaker's tool. Cinematic, with the most control over the camera.	Polished, client facing clips.
KLING FAST & AFFORDABLE	The quick, low cost engine. Strong motion for the price.	Fast tests and higher volume.
KEN BURNS CLASSIC · FREE	A classic slow pan and zoom across a still image. No AI, no cost.	Images we choose not to fully animate.

One simple rule for motion. We describe the camera move, not the scene. The building is already in the picture. We just tell the tool how to move through it, a push, a drift, a rise.

THE WHOLE IDEA, ON ONE PAGE.

Four moves, a handful of best in class tools, one repeatable flow that anyone on the team can follow.

THE | FLOW

- **Start** with the real plans.
- **Create** photoreal still images.
- **Add motion** to the best one.
- **Assemble** the walkthrough.

THE | TOOLS

- **Images.** Google's Gemini.
- **Motion.** Veo, Runway, and Kling.
- **Free motion.** The Ken Burns pan.
- **The anchor.** Always the real plans.

THREE | SIMPLE PRINCIPLES

- **Get the image right first.** Motion makes a great picture greater, and a weak one worse. Everything builds on the still.
- **Direct the camera, not the scene.** The building is already there. We only tell the tool how to move through it.
- **Make several, keep the best.** At every step we create options and choose the strongest.

Plans in. Photoreal out. Then set it in motion. That is the whole idea, and it is simple enough for anyone on the team to run. **Now go make MORE.**
